

Technical Assessment Feedback

To: Aman Singh **Position:** Full Stack Developer **Subject:** Mini Event Booking Platform - Review Feedback **Date:** January 21, 2026

Dear Aman,

Thank you for submitting your technical assessment for the Full Stack Developer position. We have reviewed your Mini Event Booking Platform application.

Your submission demonstrates good understanding of full-stack development concepts. However, during our testing, we encountered several issues with the application that need to be addressed.

Please thoroughly test your application, identify and fix the bugs, then resubmit your updated code.

Summary of Areas to Review

#	Area	What to Check
1	Event Booking Page	Test the booking flow - quantity display and +/- buttons
2	Home Page	Loading states, empty states, date formatting
3	Login Page	Check if all links work
4	Problem Solving	Solution fails for numbers ≥ 10

Areas to Review

1. Frontend - Event Booking Page

We tested the booking flow on the Event Details page and encountered problems.

Test this flow:

1. Go to any event details page
2. Look at the quantity selector between the - and + buttons
3. Try increasing the ticket count using + button
4. Try decreasing the ticket count using - button
5. Attempt to complete a booking after using the - button

Questions to ask yourself:

- Is the quantity displaying correctly?
- Does the booking work after you decrease the ticket count?
- Compare your increment (+) and decrement (-) button handlers - are they consistent?

2. Frontend - Home Page

Test these scenarios:

- What happens while events are loading?
- What happens if there are no events available?

- How do the dates appear on event cards?
-

3. Frontend - Login Page

Check:

- Do all links on the page work?
-

4. Problem Solving - Maximum Bookings

We ran your solution against multiple test cases and found that it fails for certain inputs.

Problem Statement (From Assignment):

You have multiple booking requests and limited seats. Find the maximum number of bookings you can fulfill.

Scenario:

- You have several booking requests, each requiring different number of seats
- You have a fixed number of total available seats
- You want to maximize the NUMBER of bookings (not seats filled)
- A booking must be fulfilled completely (no partial bookings)

Example:

Input: requests = [3, 2, 5, 1, 4], totalSeats = 10

Output: 4

Explanation: Accept bookings requiring [1, 2, 3, 4] seats = 10 total, 4 bookings

Your solution passes these test cases:

Input: [3, 2, 5, 1, 4], totalSeats = 10 → Expected: 4 ✓

Input: [5, 5, 5], totalSeats = 10 → Expected: 2 ✓

Your solution FAILS these test cases:

Input: [10, 2, 1], totalSeats = 13 → Expected: 3

Input: [15, 8, 3, 2], totalSeats = 13 → Expected: 3

Input: [100, 20, 5, 3], totalSeats = 28 → Expected: 3

Resubmission Instructions

1. Test your application thoroughly
 2. Identify and fix all issues
 3. Verify your problem solving solution with the failing test cases
 4. Push your changes to the same GitHub repository
 5. Reply to this email once fixes are complete
-

Evaluation Criteria for Resubmission

- All critical bugs must be fixed
- Booking flow must work completely (increase, decrease, book)
- Problem solving solution must pass all test cases

- Code should be clean (no debug statements)

We appreciate your effort on this assignment. Please address the issues and resubmit your updated code within **2 business days**.
